

# Venture 1 Consulting Windows 10 Deployment

## Windows 10 Add-On Packages

Delivering a stable, supportable and secure desktop to end users is high on most businesses' IT priority list. Yet a Windows 10 deployment can often be a lengthy, complex and expensive exercise. Our Windows 10 Deployment 'Building Blocks' allow customers to take a logical, manageable and fully quantifiable approach to break the back of the problem.

**Add-On Packages** enhance the functionality and capabilities of the Windows 10 build created during the Live Proof of Concept Package by introducing elements such as patch management, device encryption and cloud identity.

### Patch Management

■ **Timeline: 2 Days**

This package adds Windows 10 patch management onto the Proof of Concept. Patch management is critical to help protect users from malicious software and viruses. It also allows PCs to remain supported.

Included:

- **Windows Software Update Services integration into SCCM**
- **Updates added to the platform for Windows build and in-scope applications**
- **Tested and documented patch processes**

### Enterprise Ready Windows Store

■ **Timeline: 2 Days**

Windows Store for Business allows the acquisition, management and distribution of applications in bulk to users using the built-in Windows 10 store.

This package adds Windows Store to the SCCM deployment, with some example applications.

Included:

- **Enablement of enterprise ready Windows Store with example applications**
- **Tested and documented processes**

### Bitlocker Device Encryption

■ **Timeline: 2 Days**

To ensure that a stolen or lost laptop does not cause a security breach, the data on that laptop needs to be encrypted at rest. This is often a security requirement for businesses.

This package adds BitLocker device encryption policies and infrastructure. Depending on the customer's environment and time available, this can include MBAM management (additional server required).

Included:

- **Windows Software Update Services integration into SCCM**
- **BitLocker encryption policies**
- **Tested and documented client encryption and decryption processes**

## Cloud Identity

### ■ Timeline: 2 Days

Many organisations are migrating to the cloud for services such as Office 365. Therefore with some cloud features, such as Office 365 Conditional Access Policies, the rules can be based on workstation Azure AD membership.

This package adds hybrid workstation domain join, where the workstation becomes a part of the internal domain and Azure Active Directory. This requires that the organisation is already synchronising their users to Azure as part of Office 365.

Included:

- **Change to the Microsoft ADC to allow synchronisation of workstations**
- **Change to scope to synchronise the Proof of Concept workstations to Azure AD**
- **Handover and documentation of change**

---

## Azure Autopilot

### ■ Timeline: 2 Days

Microsoft Azure Autopilot (and Windows Configuration Designer) can provide alternatives to traditional Windows 10 management with SCCM. Rather than building the Windows client from bare-metal up, these tools can modify the "Out Of Box" experience to directly join a new Windows 10 PC to the customer's Azure Active Directory.

This package sets up a simple Autopilot environment to demonstrate an alternate Windows "deployment" and management approach. The result is a Windows 10 PC joined to, and potentially managed by, the Azure Active Directory.

It assumes that the customer has an active Azure Active Directory environment (such as a synchronised Office 365 directory) with Azure AD Premium P1 or P2.

Included:

- **Enablement of Enterprise ready Windows Store with example applications**
- **Tested and documented processes**
